

Industry is providing
solutions for a world
in transition!

ADVANCED INDUSTRIAL FACILITIES

In the collective psyche, industrial development and environmental conservation are at odds with each other. The primary role of industry is to supply raw materials, commodities, consumer goods and energy to the world's exponentially increasing population, whose changing lifestyles are causing an imbalance in the energy system.

And yet significant progress has been made in the past few decades, often spurred by increasingly stringent regulations and growing pressure from civil society.

The geopolitical, health and energy crises we are currently experiencing are unprecedented: soaring prices of fuel and raw materials, challenges to historical interdependence at a global scale, and new consumer expectations are forcing decision-makers to embrace environmental issues. This gives industrial firms a clear incentive to rethink their investments in order to factor these issues into each stage of their projects.

Today, therefore, industry must continue its transformation and demonstrate that it is playing its full part in meeting the major environmental and social challenges facing us all:

**industry is providing solutions for a
world in transition!**
